Input on the page:

Dear sir /madam,

My inputs is as follows.

Make clear emissions from grid electricity using fossil fuels being replaced.

Is the electricity generated under the project supplied to the community, if not how is the community going to benefit from the project?

How is the cost of production going to be affected?

Will the new input of power as a source of production affect the profit?

What are the role of civil society in means of verification?

Was the community made aware of pollutants and polluted material related to the project with adequate mitigation measures in place?

Are the baseline indicators established during scoping stages, open up to the public to be used as reference for assessment?

Kindly due to time limit, I had more concerns.

Hope, this can contribute on making the project a success.

Thanks.
